## **Change atmospheres by pushing a button.**

Combined media technology allows to control the atmosphere of a room from one central point. Automated cross-links enable not only the quick variation between the different types of use (e.g. standard operation, performance / presentation, theme event), but also programming for all lighting elements for years in advance. Modern visuals are streamed by a server or delivered by manual operation.

A fog screen, 15 meters wide, in which three-dimensional sunflowers sway from side to side. Alternating it's form within seconds, occasionally freeing the view on a large river which flows behind it. In the next area you lie completely quiet on the water surface of a body-warm brine basin - with ears under water - listening to music. The eyes directed upwards seeing floating stones and insects in a large dome, in the background a flower meadow. The entire area is lit up by a light that fits nicely to the projections. the room smells of wild herbs.

Installations, in which projections with LED components and variable background lighting are connected are very useful for public spaces like clubs, restaurants and retail stores.
